🫁 Patient approach

1. **Recruit eligible asthma patients**
    - **Must meet your study's inclusion criteria.**
    - **Recruitment can be coordinated through a clinic, hospital, or healthcare practitioner, following your approved research procedures.**
2. **Explain Ausculta**
    - **Explain what the proposed app is for.**
    - **Tell them clearly that it is still a prototype and is not being used for diagnosis or treatment.**
3. **Let them navigate the prototype**
    - **Give them simple tasks rather than teaching them every button.**
    - **Example: "Find where you can view your respiratory assessment results."**
4. **Observe their interaction**
    - **Were they able to find the features?**
    - **Did they understand the buttons/icons?**
    - **Did they encounter confusion?**
5. **Let them answer your validated questionnaire**
   Focus on things patients can reasonably evaluate:
    - **Ease of use**
    - **Ease of navigation**
    - **Understandability**
    - **Perceived usefulness**
    - **Acceptability**
    - **Overall user experience**
6. **Optional short interview**
   Ask:
    - **"What part of the app was easiest to use?"**
    - **"What part was confusing?"**
    - **"What feature would you want to add?"**
    - **"Would you be comfortable using an app like this for respiratory monitoring?"**

🫁 Pulmonologist / Health Practitioner

Focus: ***Clinical relevance, safety, and usefulness***

Approach:

1. **Briefly introduce the problem your study addresses.**
2. **Explain the concept and intended use of Ausculta.**
3. **Show the prototype and let them navigate the relevant features.**

4. **Ask them to evaluate whether the information, workflow, and features are appropriate for asthma/respiratory monitoring.**
5. **Conduct a short semi-structured interview afterward for expert feedback.**

ask things like:

- **Are the information/features relevant to patients with asthma?**
- **Is the presented respiratory information understandable?**
- **Are there features that may be misleading or inappropriate?**
- **What clinical information should be added or removed?**
- **In what situations could an app like this be useful?**

💻 Computer Engineer

Focus: *Software usability, functionality, and system design*

Approach:

1. **Introduce Ausculta and its intended users.**
2. **Give them access to the prototype.**
3. **Give specific navigation tasks.**
4. **Let them independently explore the interface.**
5. **Ask them to evaluate the prototype's:**
    - **Navigation**
    - **User interface**
    - **Information architecture**
    - **Ease of use**
    - **Consistency**
    - **Functionality**
    - **Potential technical limitations**

⚡ Electrical Engineer

This depends heavily on what Ausculta's hardware/sensing component is supposed to do.

Focus: *Hardware feasibility, sensors, signal acquisition, and electrical/system considerations.*

If your proposed Ausculta involves capturing respiratory sounds, you can show them your proposed hardware/system architecture and explain how the audio would theoretically be captured and processed.

Ask them to assess:

- **Feasibility of the proposed hardware**
- **Sensor/microphone selection**
- **Signal acquisition**
- **Power requirements**
- **Connectivity**
- **Possible electrical interference/noise**
- **Hardware limitations**
- **Whether the proposed system is technically realistic**
